**Supplemental Video 1.** Live endoscopic imaging (in the duodenum) of the hookworm mucosal piercing through a quick spinning movement with a second piercing (for repeated feeding) by the same worm in a nearby site while the previous one was still oozing blood.

**Supplemental Video 2.** Live endoscopic imaging (in the duodenal bulb just distal to the pyloric ring) of a male hookworm graceful movement with the anterior end fixed to the mucosa while bloody fluid is excreted as a thin film around the broad posterior end.

**Supplemental Video 3.** Live endoscopic imaging of a struggling hookworm movement after being caught by the forceps from the jejunum.
